

The Diamond QC

One artifact, four roles. It passes from the author to two independent auditors to a meta-auditor before it ships. The shape is the teaching device.

TIERING BY RISK

Match effort to risk.

Run only as much of the diamond as the risk demands. Most work is not FULL.

SKIP ⦿ ⦿ 0 lenses	Trivial, reversible, or already verified by execution. Just do it, no diamond.
LIGHT ● ⦿ 1 lens	Low to moderate stakes. Author plus one auditor, no meta layer, then verify the fix.
FULL ● ● ◆ 2 + meta	High stakes: shipped to others, has stats or safety logic, hard to reverse. Two auditors plus the meta-auditor. This is the diagram shown.

→ Escalate by a different lens, not a repeated pass.

READING THE DIAGRAM	
—	Structure and flow
—	Auditor A, the Fidelity lens
—	Auditor B, the Execution lens
✓	Meta promotes a real miss
✗	Meta kills a false finding

A single reviewer shares blind spots with itself. Independent, differently-aimed verification catches what one pass cannot.
